

# MedRelay

**MedRelay will ensure that your confidential files get to where you need them to be!**

Now there is a way to move files in an easy-to-use and secure fashion. There is no need to setup complicated File Transfer Systems or email large attachments to others and hope to get through spam filters and size limitations.

MedRelay provides both Transcription Companies and Medical Groups a complete Dictation and **Transcription File Management System**. With an easy-to-use, web-based interface, MedRelay will help facilitate the transaction of data between you and your Transcription Clients. The solution is role-based providing for simple, understandable access to the data by different parties involved in the transaction.

MedRelay provides you with an online account and a software agent to **install on any PC**. With the connection of a Dictaphone your MedRelay agent automatically detects and uploads any new dictation to your secure account.

All files are transferred in real-time as they are created on the Provider's PC. The files are transferred using the PC's existing internet connection within a **128-bit SSL Tunnel** to your MedRelay Account. All data is stored on the MedRelay Servers in a secure Data Center. File transfers are date & time stamped for organization and searching purposes.

- Send your medical data in a HIPAA compliant environment
- Eliminate Complicated File Transfer Setups
- No need to wonder if your file attachment made it over email
- Date & Time Stamp your file transactions
- Keep all your file transfers in one place
- Be notified when a new file has uploaded to your account.
