

MedRelay

MedRelay is your swift, secure and effective medical data exchange service.

MedRelay will ensure that your confidential files get to where you need them to be!

Now there is a way to move files in an easy-to-use and secure fashion. There is no need to setup complicated File Transfer Systems or email large attachments to others and hope to get through spam filters and size limitations.

MedRelay specializes in Software as a Service and Data Management. We have combined those two aspects of IT to provide our clients with a highly functional online software experience. **Ease-of-use** is our primary objective and is a benefit that we are proud to extend to our clients.

Our Data Storage Systems can be found in separate, secure NOCs around the country. Utilizing security and redundancy tools such as SSL and redundant networks we can provide the ultimate in online data management.

MedRelay was created by a group of talented Developers, Testers, Project Managers and Engineers and utilizes industry resources to provide testing of custom features and services. The MedRelay service was developed out of demand for a secure, organized, compliant and stable medical data transfer method utilizing the bandwidth and resources of the internet. Taking full advantage of these features of the internet and the skills and expertise of our proficient team allows MedRelay to quickly present your data to you in a manageable, protected and dedicated manner.

Transcription Service Features

MedRelay provides both Transcription Companies and Medical Groups a complete Dictation and Transcription File Management System. With an easy-to-use, web-based interface, MedRelay will help facilitate the transaction of data between you and your Transcription Clients. The solution is role-based providing for simple, understandable access to the data by different parties involved in the transaction.

MedRelay provides you with an online account and a software agent to **install on any PC**. With the connection of a Dictaphone your MedRelay agent automatically detects and uploads any new dictation to your secure account.

All files are transferred in real-time as they are created on the Agent PC. The transfer uses the existing PC's internet connection and a **256-bit Secure Tunnel** between the MedRelay Agent and your MedRelay Account on the MedRelay Servers at our secure Network Operations Centers (NOCs). All file transfers are date & time stamped for organization and searching purposes.

To start using the MedRelay data exchange service simply download the agent, enter a 6-digit code and wait for the files to start arriving in your account.

Stop wondering if your email attachments got through...your FTP site is secure...your password correct...

- **Send your medical data in a HIPAA compliant environment**
- **Eliminate Complicated File Transfer Setups**
- **No need to wonder if your file attachment made it over email**
- **Date & Time Stamp your file transactions**
- **Keep all your file transfers in one place**
- **Be notified when a new file has uploaded or returned to your account.**

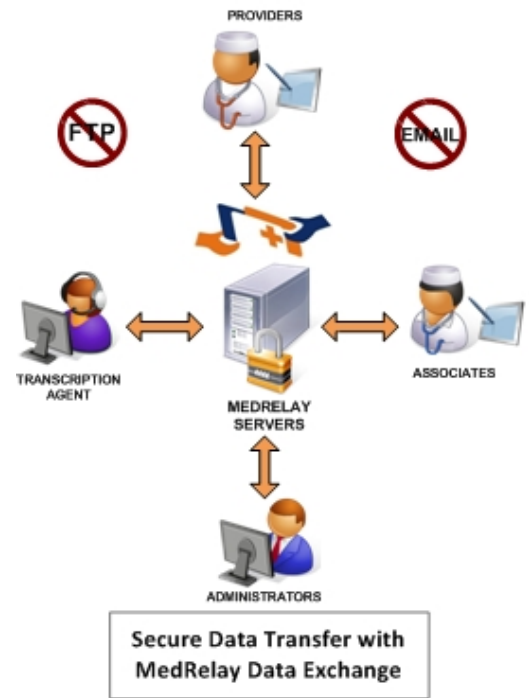

MedRelay

Technology

Swift - MedRelay was built on the concept that data exchange between businesses, individuals and organizations should be a **fast, simple and stable process**. MedRelay provides our clients with a robust and HIPAA compliant digital platform for the movement and management of data in a structured manner. MedRelay utilizes T1 bandwidth from our NOCs to provide the fastest possible access speeds for your data.

Secure - MedRelay is based on a feature-rich platform that understands the critical nature of moving data from location to location in a secure manner. Using **secure 256-bit encryption**, MedRelay passes data from any PC location to your central server account housed in our secure Network Operations Center (NOC) with full redundancy. The security of your medical data is paramount to our service and the MedRelay secure exchange service provides you with assurance that your medical data is safe from prying eyes and is transmitted in a HIPAA compliant setting.

Exchange - MedRelay is based on a "Platform" and "Module" Architecture. The Platform performs all the data movement and consists of the secure server and agent communications. The Modules handle the presentation of the data to the end-user. We have built many **custom front-ends** to help our clients view and control their data in a very simple fashion. Because MedRelay was created in this way, we have the ability to create additional practical industry modules for this platform.

MedRelay's Benefits

<input checked="" type="checkbox"/> Catalog and Search Transcriptions	<input checked="" type="checkbox"/> HIPAA Compliant 256-bit SSL Encryption
<input checked="" type="checkbox"/> Hosted Solution (No costly set up)	<input checked="" type="checkbox"/> Remote Access from any Internet connection
<input checked="" type="checkbox"/> Thorough Data Organization	<input checked="" type="checkbox"/> Eliminate 'Lost' Dictation
<input checked="" type="checkbox"/> Easy End User Management	<input checked="" type="checkbox"/> Simple Deployment
